

SecureGate

SecureGate checks a code project for **secrets**: passwords, keys and tokens that give access to money, data or servers. It looks through every saved version of the project, not only the latest one. One readable file, `policy.yaml`, decides what happens to each thing it finds: **block**, **warn** or **ignore**. It never shows a whole secret: a found key appears as `sk_1****562d`. It checks each commit on your laptop and each pull request on GitHub, a read-only dashboard shows the results in your browser, and optional AI agents explain them.

Completed: built by Team Nexora for Microsoft Innovate 2026 (Problem Statement 24). Version 1.0.0 is the last release, and the project is not actively maintained. Everything on these pages works as described; what was never built is listed in the Roadmap ([roadmap.pdf](#)).

See it work: on Windows, double-click `Start SecureGate.cmd` in the SecureGate folder. SecureGate opens with its menu. Type 1 and press Enter to scan a demo project full of fake secrets, then press Enter again to see the results in your browser. Type 9 to see the gate on GitHub: SecureGate opens a real pull request with a fake key, and shows how the check stops it. Type A for the AI agents: triage, fixes and an incident plan for the findings. The first time, install the tools in step 1 of Getting started ([getting-started.pdf](#)).

Start here

Page	Read it when you want to...
Getting started (getting-started.pdf)	install SecureGate, run your first scan, and look up every command
Demo day (demo-day.pdf)	show SecureGate to anyone in 10 minutes, from the menu, step by step
Protect any repository (install.pdf)	give another GitHub repository the same two gates: the GitHub Action and the pre-commit hook

Use it

Page	Read it when you want to...
How it works (how-it-works.pdf)	follow one leaked key from discovery to report
The two gates (merge-gate.pdf)	stop secrets before a commit (laptop) and before a merge (GitHub), and turn the GitHub check on
Demo: the merge gate (demo-script.pdf)	show the GitHub check at work in five scenes, from the menu or with one command each
Dashboard (ui.pdf)	see a report in your browser, download or print it, or change the dashboard's colours
The AI agents (agents.pdf)	get AI advice on the findings: triage, a fixed line of code and an incident plan
Testing (testing.pdf)	plant a new secret in the demo repo and read the scorecard

Understand it

Page	Read it when you want to...
How it's built (how-its-built.pdf)	find your way around the files, or change a behavior
Decisions (decisions.pdf)	know why something is the way it is
Limitations (limitations.pdf)	know what SecureGate does not do, and what to do about it

Page	Read it when you want to...
Glossary (glossary.pdf)	look up a word

The project

Page	Read it when you want to...
Project closure (project-closure.pdf)	see what was built, what works today, the final results, and how to bring each part back
Roadmap (roadmap.pdf)	see what was planned but never built
History (docs/history/README.md in the repository)	read the working notes and plans from the build, kept as they were written
Changelog (CHANGELOG.md in the repository)	see what changed, stage by stage
Security (SECURITY.md in the repository)	report a problem, and know why every key here is fake
Close-out checklist (CLOSEOUT-CHECKLIST.md in the repository)	see what is left for the repository's owner to do
License (LICENSE in the repository)	reuse the code: MIT, Copyright (c) 2026 Team Nexora
The front page (README.md in the repository)	see the project at a glance

Every page in `docs/` is also a PDF, for printing or sharing: see the `docs/pdf/` folder. The pages above are the originals. After changing one, run `make docs-pdf` to update its PDF.
