

SecureGate

SecureGate checks a code project for **secrets**: passwords, keys and tokens that give access to money, data or servers. It looks through every saved version of the project, not only the latest one. One readable file, `policy.yaml`, decides what happens to each thing it finds: **block**, **warn** or **ignore**. It never shows a whole secret: a found key appears as `sk_1****562d`. It checks each commit on your laptop and each pull request on GitHub, and a read-only dashboard shows the results in your browser.

Pages

Page	Read it when you want to...
Getting started (getting-started.pdf)	install SecureGate and run your first scan
How it works (how-it-works.pdf)	follow one leaked key from discovery to report
Dashboard (ui.pdf)	see a report in your browser, or change the dashboard's colours
The two gates (merge-gate.pdf)	stop secrets before a commit (laptop) and before a merge (GitHub), and turn the GitHub check on
Demo: the merge gate (demo-merge-gate.pdf)	show the GitHub check stopping a fake key, step by step
How it's built (how-its-built.pdf)	find your way around the files, or change a behavior
Testing (testing.pdf)	plant a new secret in the demo repo and read the scorecard
Glossary (glossary.pdf)	look up a word
Decisions (decisions.pdf)	know why something is the way it is

Every page is also a PDF, for printing or sharing: see the `docs/pdf/` folder. The pages above are the originals. After changing one, run `make docs-pdf` to update its PDF.
